

# Descaling in rolling mills

## High pressure descaling improves product quality

In today's price competitive rolled steel products market the quality of product has become the most important selling criterion.

Removal of mill scale by high pressure water is a proven process used in the production of high quality milled steel products. Hammelmann design and supply individual systems to suit customer requirements.

Hammelmann systems incorporate high performance, vertical triplex or quintuplex plunger pumps that consume far less energy compared to other pump types.

The costs saved by low power consumption combined with longer roller life result in economically viable descaling systems.

- Higher quality steel products
- Lower energy costs
- Longer production plant life
